PROFESSIONAL SUMMARY

I'm a Data Analyst with 5+ years of experience across data reporting, ERP implementation, and BI development. Over the years, I've worked on everything from writing complex SQL queries and building Power BI dashboards to sitting with business teams, understanding their workflows, and helping translate those into working ERP systems. My background spans HR, Finance, Accounts, Inventory, and Sales — which means I pick up business context quickly and don't need much hand-holding when it comes to understanding what data actually means for a business. I've also done hands-on work in Python automation, ETL pipelines, and even deployed an ML model on AWS in a previous role. I work well with both technical and non-technical people, and I genuinely enjoy solving the messier, less-obvious data problems.

CORE TECHNICAL SKILLS

Databases & SQL: MySQL, PostgreSQL, SQL (Joins, CTEs, Window Functions, Subqueries), ETL, Data Modeling

BI & Reporting: Power BI (DAX, Data Modeling), Tableau, Chart.js, Streamlit, Plotly Express, Excel

Programming: Python (Pandas, NumPy, Scikit-learn, scripting), TypeScript, Jupyter Notebooks

ERP & Business Analysis: ERP Implementation, Requirement Gathering, Functional Documentation, User Training, Go-Live Support

Tools & Infrastructure: AWS, Git, CI/CD, RESTful APIs, Postman, Apache Kafka, Linux/Ubuntu, Cron Jobs

Domains Worked In: HR & Payroll, Finance & Accounts, Inventory, Sales, Banking Compliance, Government Reporting

WORK EXPERIENCE

Data Analyst – ERP Reporting & BI | *RECAT Digital Solutions, Mumbai* Nov 2023 – Present

- My primary work here involves building and maintaining the reporting layer for an ERP platform used by multiple clients. I work with MySQL and PostgreSQL databases — designing schemas, optimizing queries, and making sure the data is clean and reliable for reporting.
- Developed 4 Power BI dashboards (with DAX measures) that the management team uses daily to track attendance, overtime, financial performance, and HR KPIs. These replaced manual Excel-based tracking that was taking hours every week.
- Set up and now maintain 10+ MIS and compliance reports — 6 of which run every month and go directly to banking and government bodies. Getting these right the first time matters a lot, so I've put validation checks into the process.
- Wrote Python scripts to automate the ETL process, which cut down manual reporting effort by around 20%. Nothing fancy — just removing the repetitive parts that were eating up time.
- Took on two ERP implementation projects from scratch. For a commission agent business (waste paper and stocklots), I spent time with the team understanding how they actually work — indent creation, buyer-shipper documentation, query handling. I documented all of it and turned it into requirements for the developer: what data to capture, how screens should look, what emails should go out automatically and with which attachments. Once the ERP was built, I trained the team, collected their feedback, and made sure the gaps were fixed before we called it done.
- For a paper company (retail and wholesale), I coordinated the ERP rollout covering inventory, purchases, and sales — including purchase orders, sales orders, tax challans, and delivery challans. Interesting part:

they didn't have a traditional database — everything saved to Google Drive. I worked with the developer to build around that and then trained the team on the new system.
- Handle API integrations between the ERP and third-party systems using Postman for testing. Also manage database backups via cron jobs on Linux — set and forget, but important to have right.
- Created a pricing dashboard in Streamlit that uses an ML model to suggest selling prices with a real-time margin risk alert. The sales team uses it to avoid quoting prices that would eat into profit.

Technologies: *SQL, MySQL, PostgreSQL, Python, TypeScript, Power BI, DAX, Excel, Chart.js, Streamlit, Kafka, Postman, Git, Linux/Ubuntu*

Data Analyst – BI & Advanced Analytics | *Rebase IT Labs, Mumbai* Nov 2020 – Oct 2023

- Worked on BI and analytics projects for clients in the music industry and US tax domain. Most of my time went into building Power BI and Tableau dashboards and writing Python scripts for data analysis.
- One of the more interesting projects was deploying a machine learning model on AWS that automatically tagged and classified entities for a US tax client. I handled the data prep, model training, and deployment — and it replaced a largely manual tagging process.
- Wrote Python scripts for sentiment analysis and affinity tracking — basically understanding how audience sentiment for artists changed over time. This fed into marketing decisions for the client.
- Also wrote some data scraping scripts using open APIs to pull in external data that didn't exist in our internal systems.
- Worked with Tableau alongside Power BI for some clients who had existing Tableau setups. Comfortable switching between the two.

Technologies: *Python, Power BI, Tableau, AWS, Jupyter Notebooks, Open APIs, Scikit-learn*

EDUCATION

Master of Science – Statistics 2018 – 2020
Mithibai College, University of Mumbai

Bachelor of Science – Statistics 2015 – 2018
Mithibai College, University of Mumbai

A FEW THINGS WORTH KNOWING

- I've worked on both sides of ERP — building the data and reporting layer as a developer, and sitting with business teams as the person who figures out what they actually need.
- My compliance reporting work (banking and government) means I'm used to getting things right under deadline pressure — no room for errors there.
- I pick up new domains reasonably fast. I've gone from music industry analytics to US tax classification to HR/Finance ERP reporting without needing months to ramp up.
- Notice period is 15 days — can join fairly quickly if the fit is right.
